Abstract
Many urban communities in the United States have experienced decades of systematic residential segregation, resulting in concentrated poverty as well as its associated consequences, such as violence, trauma and hopelessness. Social workers and other human service providers often respond to the consequences of poverty and oppression, while ignoring the oppression itself; in essence this suggests that the client is experiencing challenges because of individual or personal actions. This article introduces a framework through which providers may view issues of oppression impacting their client, as well as partnering with clients to create plans of action to counter oppressive policies and structural issues. The five components in the SHARP framework are: Structural oppression; Historical context; Analysis of role; Reciprocity and mutuality; and Power. Through this framework, both macro and clinical social workers can focus their work with clients on addressing both the root causes of poverty and their consequences.

Keywords: empowerment, structural oppression, racism, social work ethics, poverty

A History of Separate and Unequal Living Environments
Beginning in the 1970s and 1980s, urban communities saw a dramatic increase in concentrated urban poverty as racial housing restrictions in the suburbs eased and upwardly mobile African Americans moved into the suburbs, leaving behind a concentration of very poor families and individuals. Other theories about elements contributing to the increased concentration of poverty in urban communities include the loss of manufacturing and other local jobs, economic and social disinvestment in cities, blight and decay (Shaia, 2016a; Sessoms & Wolch, 2008; Yang & Jargowsky, 2006). Additionally, Black and Hispanic children are much more likely to live in poverty than their White counterparts, and those Black or Hispanic children are overwhelmingly more likely to live in communities made up mostly by people of the same race (Drake & Rank, 2009). This concentration of poverty is seen most clearly in older, industrial cities in the Northeast, such as Newark, New York and Baltimore (Ricketts & Sawhill, 1988).

While geographic concentrations of poverty decreased in the 1990s, these Northeast cities still see a significant concentration of very poor people living in certain neighborhoods. Urban poverty should routinely be considered within the neighborhood context, even more than in the family context. It has been shown that, even if a particular family is not impoverished, that family will experience a number of significant disadvantages, and the children will be exposed to the cumulative effects of multiple risk factors, simply by virtue of living in a neighborhood of concentrated poverty (Shaia, 2016a; Drake & Rank, 2009).
While most Americans recognize that urban America is still segregated racially, economically and socially, many view this segregation as an unfortunate holdover from a racist past. They believe that the civil rights laws passed in the 1960s simply have not had enough time to work, or that this segregation is a natural outcome of a preference to live together, or even the idea that segregation is caused by interpersonal forces within communities of color (Massey & Denton, 1993). Despite their acknowledgment of these disparities, many Americans do not understand the systematic use of urban planning and zoning laws to create and maintain racial and social segregation dating back to the early twentieth century. Popular devices used to create racial and social segregation included the restrictive covenant, a private contract denying home sales or rentals to Blacks and Jews; redlining or creating a nomenclature of zoning based on racial designations (R1 – White district, R2 – colored district, and R3 – undetermined); and the siting of public housing projects explicitly for Black occupancy. The belief behind this segregation was that racially homogeneous neighborhoods promote social stability, and that this segregation would instill in Blacks a more “intelligent and responsible citizenship” (Silver, 1997). Redlining was particularly damaging because it not only specified where people could live, but it allowed real estate appraisers to place lower values on homes in Black neighborhoods, thus steering lenders away from these areas and ensuring that properties in these neighborhoods did not appreciate and provide the wealth to Black families that homeownership usually brings (Mohl, 1997).

Between 1940 and 1960 approximately five million African Americans migrated from the South to urban centers in the North and West. This mass migration of Blacks into segregated cities, which stretched the boundaries of inner-city ghettos, was seen as a “Black invasion” by Whites, who fled in large numbers to the suburbs, from which Blacks were largely excluded. As the proportion of Black people in urban centers grew, so also did overcrowding and violence, as Blacks sought to move into White neighborhoods and Whites sought to prevent that migration. In cities across the country, bombings, cross burnings and other forms of violence characterized relationships between Blacks and Whites. Federal housing agencies supported discriminatory housing practices designed to eliminate Black “infiltration” into White neighborhoods, and were central to characterizing Black neighborhoods as having low value real estate and, thus, being a high risk for real estate lenders and investors (Pietila, 2010; Mohl, 1997).

Over the following decades, despite legislation such as the Fair Housing Act of 1968, segregation of habitation continued. This resulted in high rates of unemployment, inflation, low wages, increasing inequality, and deepening poverty for people of color (Pietila, 2010; Massey & Denton, 1993). In the same way that policymakers, scholars and the public have been reluctant to recognize and acknowledge racial segregation’s existence, they have been reluctant to acknowledge its continuing consequences for communities of color. The effects of segregation on well-being are structural, not just individual, and lay beyond the ability of any individual to change, thus constraining opportunity, individual motivations, or private achievements (Massey & Denton, 1993).

**The lingering impact of oppression**

Segregation compounds its negative impact on a community by bringing together, in a concentrated form, all of the consequences of poverty, such as increased crime, which can quickly destabilize a community. Residents of segregated, poverty-impacted communities are far more likely to be victims of crime than are residents of non-segregated communities. Additionally, young people learn attitudes and behaviors from the people around them, such as how to get and keep a job, how to advance in school, how to have successful relationships, and how to be financially self-sufficient. In the absence of opportunity, joblessness, marital disruption and welfare dependence become the norm (Massey & Denton, 1993). Living in poverty creates significant stressors, which impact families’ ability to maintain healthy relationships,
parent their children and adapt to life circumstances (Conger, Conger & Martin, 2010; Conger, Schofield, Conger, & Neppl, 2010; Wadsworth, et al. 2013). Children may be exposed to the cumulative effects of multiple risk factors, including the effects of poverty, maltreatment, violence, and parental stress, which often co-exist (Wadsworth & Santiago, 2011; Appleyard et al, 2005). Children, as young as pre-schoolers, often carry the weight of poverty-related stress, either because they are directly impacted by food insufficiency and inadequate housing, or because they are cared for by frustrated, irritable, worried adults (Wadsworth & Berger, 2006; Ackerman et al, 1999; McLoyd, 1990). Additionally, hopelessness is significantly associated with poverty, stress, anxiety and depression (Carter & Grant, 2012).

This paper addresses service provision within the context of a history of systematic oppression. While the paper addresses issues which impact poor Whites, the focus will remain on African-Americans, as the race which has the highest poverty rate of all races in the United States (Proctor, Semega & Kollar, 2016), and because of their experiences of enslavement, segregation, and oppression.

**The issue of disempowerment**

It is relatively easy to understand how a woman who has been sexually assaulted may be impacted by her assault. She may become angry, depressed, have difficulty sleeping, feel hopeless, and ashamed. She may feel unsafe in many environments, may have difficulty with relationships, may fear going places alone and taking risks. This all makes perfect sense, in light of what she has experienced. If she was raised by a mother who was also sexually assaulted, and if every woman in her family history going back generations had experienced the same assault, one would expect to see significant impacts on how that woman and the women in her family interact with the world.

Yet many people, including social workers, do not apply the same level of understanding to a people who were forcibly kidnapped from their homeland, brought to another country, placed with people whose language and customs they may not have known, and then forced to work like animals while being subjected to familial separation, beatings, rape and murder. While these people have since been freed from the atrocities of slavery, other systems have grown up to take its place, including planned segregation, mass incarceration and police brutality (Alexander, 2010). In the above example, we might expect that the women who have been sexually assaulted for generations might doubt their own power to change their situation (after all, no-one in that family has been able to stop the violence to date), and might internalize their abusers’ view that they are powerless, unworthy, and perhaps even deserving of the abuse. In the same way, people who have experienced structural oppression, a long history of state-sanctioned violence and unequal treatment, often internalize the narrative from the dominant culture that they are less valuable, unworthy, unintelligent, and powerless to change the status quo. In fact, it would not be surprising if people who have heard this dominant narrative for generations eventually begin to, in some way, agree with it.

**The ethics of context-blindness**

Many social workers understand the concept of the long-term impacts of a history of oppression in theory, yet many approach their clients as though the individual and family contexts are the sole contributors to that person’s current situation and expressed need. It is not uncommon for social workers to focus in on that family system during service provision, without any attention to the wider context of poverty and oppression. The reality is that experiences related to poverty and oppression may have impacted the family system even more than that family’s immediate history. At the very least, there is often an inextricable relationship between poverty, oppression, mental illness, and family dysfunction.

Failing to consider and create strategies around environmental contexts is tantamount to a physician treating a person who has come into his or her hospital for radiation poisoning without...
inquiring about the environment that led to the illness, and then sending that patient back out into the very same radiation-poisoned environment without any plan for how the person will secure and maintain access to clean air. As ridiculous and unethical as it sounds, that scenario is no different from a common social work one, where the social worker creates a plan for the client around any number of client-centered issues: depression, anger, hopelessness, joblessness, or family dysfunction, without tracing those issues back to the causes of these issues, and bringing those root causes into the service relationship as critical issues to be addressed.

Davis (2015) acknowledges that, while individual and family-focused work is necessary, the focus on remediation of the individual takes our focus off the more daunting challenge of creating structural change in society, and impacting the forces that are overpowering black people’s natural abilities to develop their own strengths. He tells the story of a man who is on his hands and knees at night under a lamppost searching around. Another man comes along and asks him what he’s doing. The first man tells him that he has lost his keys and so the second man gets on his knees to help him. After a while, the helper asks the first man if he is certain he has lost the keys in this location. The first man answers, “No, but this is the only place where there is light.” Such is the decision social workers often make about how to help people. The idea of structural work is too daunting; it is like looking for lost keys out in the dark. So we focus, instead, on the small area where there is a pool of light, trying to fix individuals, even though we know it will not change the issues that are at the root of our society’s problems (Shaia, 2016b; Davis, 2015).

Davis (2015) continues to note that although it is necessary to provide therapeutic services, strengthen families, and try to identify protective factors, focusing solely on these activities is like lining a bunch of children up and banging them all on the head with a baseball bat. Once they have been banged, we go down the line and look to see which ones have escaped without skull fractures or other serious injury. Our focus then becomes trying to identify the factors contributing to escaping the banging on the head by the baseball bat with as little injury as possible. Wouldn’t it make more sense, Davis asks, to focus on who is banging children on the head with baseball bats and stop them from doing it?

A framework to address contexts of oppression

Many examples exist of communities where people have come together to identify and address structural issues that create inequality. Most of these cases involve grassroots community organizing, which is defined by collective action by people who live in the community, involve significant numbers of people, and are built on participatory processes where people who are directly impacted by the inequality exercise leadership to decrease power disparities and achieve common goals (Staples, 2016). Yet, for many people who experience oppression and concentrated poverty, the idea of joining with others to change the root issues contributing to their pain and suffering seems like an idea that is completely beyond the realm of comprehension. The job then falls to social workers and other human service providers, as well as educators and medical professionals, to implement a framework for providing service which addresses not only the consequences of structural oppression (such as joblessness, homelessness, physical and mental illness) but supports the people with whom they work in seeing themselves, in collaboration with others, as a tool for change in their communities.

The empowerment approach to social work is driven by a commitment to unleash human potential, with the goal of building community where justice is the rule and norm. This is, at once, a clinical and community-oriented approach, and is made up of holistic work with individuals, groups, communities, and political systems (Lee, 2001). Traditional social work addresses the suffering caused by oppression, while ignoring the oppression itself (Jemal, 2017; Windsor, Pinto et al, 2014). Healing from the effects of oppression will come not from the hands of the social worker, but from
the collaboration of people in community, through a self-healing, self-empowering process of taking action through gaining resources and knowledge (Lee, 2001).

The SHARP framework is a lens through which social workers and other human service providers may view their clients and presenting issues. Like a telescopic lens, the framework allows providers to sharpen their gaze on not just the client in front of them, but all the surrounding contextual issues which accompany, are the root cause of, and intensify human suffering. Without incorporating structural issues in service, it is almost impossible for the provider to send any message to the client other than that he or she is somehow responsible for the current situation. In fact, it is difficult to comprehend how, after sending this message countless times while providing services, the social worker can avoid internalizing it him- or herself and resist resting the blame on the client, with the associated interventions. Instead of looking only at the client and blaming the client for his or her suffering, this sharpened lens encourages providers to ask questions we might not otherwise ask, and to become self-reflective in a manner that is often unusual for and uncomfortable to social service providers.

The SHARP framework includes five core components:

1. **Structural oppression** – What are the issues in the person's physical and social environment that impact the person and his or her ability to be successful?
2. **Historical context** – What historical issues impacting the person's environment/community might be relevant to the issues the person is experiencing now? How has this history contributed to the situation the person is in now?
3. **Analysis of role** – What will be the provider's role in this service relationship: maintainer or disrupter of the status quo? There is no neutral space.
4. **Reciprocity and mutuality** – What strengths and gifts can the person share with the provider and with his/her community?
5. **Power** – What can the person do, alone and/or with others, to change the impact of historical and structural oppression?

This framework is not relegated to the sole use of clinicians or therapists. Instead, it relies on the entire continuum of social work practice, from macro to clinical. This way of thinking encourages social workers to remove themselves from the silos of being either a clinician OR a macro practitioner and instead, in the same way that we view human beings as whole and complex, begin viewing the solutions to society's problems as wide, complex, and requiring new and innovative approaches. In this approach, the social worker is also whole, and views the work with the complexity it deserves.

Figure 1 displays the basic SHARP framework, while Tables 1-5 provides social workers with factors to consider in each component, as well as reflection questions and potential results of applying the SHARP framework. Within each component, the provider is encouraged to ask questions (of him- or herself, as well as of clients) about which issues impact the person; to identify policies, historical events, and structural processes that are contributing to where the person is now; and to begin to integrate these issues into dialog with the person. It is the provider’s responsibility to become versed in the particular history of that person’s community, including how zoning laws were used to create financial and social inequality; structural barriers to success, such as food deserts and lack of transportation to job centers; and the existence of current policies which continue to perpetuate inequality and victimization of Black communities, such as police profiling and mandatory sentencing laws.
The framework also requires the provider to make a decision about whether he or she will work to *maintain* the status quo (focus on meeting the immediate needs of people served, without addressing the oppressive structures creating those needs), or work to *disrupt* the status quo (look deeply into the issues creating the needs, and work with people impacted to recognize their power to create change). There is no neutral position in this decision. In most cases, disruption of the status quo requires the provider make a conscious decision to do so or, at the very least, to consciously identify oppressive systems at work. When providers do not consider oppressive systems, and do not address these issues in their service relationship, they are by definition implicitly endorsing the status quo. At times, a provider may make a conscious decision to maintain the status quo, and to avoid introducing issues of oppression into service provision, but that should not be a default position; rather, the decision should be made after careful consideration of the issues. This may be a temporary decision, which the provider will re-evaluate at a later date.

### Table 1: Structural Oppression

<table>
<thead>
<tr>
<th>SHARP Component</th>
<th>Factors to Consider</th>
<th>Reflection Questions</th>
<th>Potential Results of Applying SHARP framework</th>
</tr>
</thead>
</table>
| **Structural Oppression** | Is the person impacted by:  
- Linear effects of housing discrimination  
- Inadequate access to decent, affordable housing  
- Inadequate, efficient transportation to job centers  
- Lack of access to jobs paying a living wage  
- Lack of access to decent, affordable education  
- Limited access to quality healthcare  
- Difficulty accessing healthy, affordable food  
- Inadequate access to successful role models who look like them  
- Few lawyers interested in meeting community needs | Consider:  
- Which policy or structural issues specifically are contributing to the person’s situation?  
- How are multiple overlapping structural issues contributing to what the person is experiencing?  
- How has the person internalized the oppression he or she has experienced?  
- How can services and interventions be applied without inadvertently blaming the person for being a victim of structural oppression? | Provider recognizes and speaks as:  
- The complex nature of environmental issues impacting person’s ability to be successful  
- That many or even most of the barriers the person faces are the result of racist oppressive policies and practices in the larger environment  
- How these issues interact with each other to impact the person’s life - root causes, in addition to symptoms  
- Which needs should be a basic human right, e.g. housing, health care, food security, etc.  
- Inequities in how resources are applied across society |

### Table 2: Historical Context

<table>
<thead>
<tr>
<th>SHARP Component</th>
<th>Factors to Consider</th>
<th>Reflection Questions</th>
<th>Potential Results of Applying SHARP framework</th>
</tr>
</thead>
</table>
| **Historical Context** | Does the person’s community have a history of:  
- Racism/housing practices such as block housing, redlining, predatory lending, racial steering, slum clearance, isolating public housing, gentrification, dangerous environmental practices, and exclusionary zoning laws?  
- Concentrated, intergenerational poverty caused by white flight, business disinvestment, school segregation/inequality?  
- Racism/policing and criminal justice practices?  
- Community members expressing frustration, hopelessness and/o anger through civil unrest, violence, crime and substance abuse? | Consider:  
- How has the historical context impacted the person’s responses to his/her environment?  
- Considering the historical context, what should a “normal” response/functioning look like?  
- How might this history impact issues such as coping, trust, relationships, conflict management, pride, dignity, self-esteem, locus of control, hope, and personal/collective agency? | Provider recognizes and speaks as:  
- Issues impacting the person’s situation which are deeply steeped in history  
- How historical issues impact the wider community/environment  
- That many issues have an intergenerational context, and impact how the person sees and reacts to the issues  
- That history has a significant impact on the person’s belief about whether or not positive change is achievable |
Traditionally, the social work relationship has mirrored the doctor-patient relationship, characterized by strong and often impermeable boundaries. These boundaries were created to separate social workers from the people with whom they work. But social workers have begun to rethink the structure of these relationships, in favor of relationships that connect the social worker to the person with whom he or she is working, rather than separates them (O’Leary et al., 2013; Ruch, 2005).

In the SHARP framework, the provider is encouraged to view the person with whom he or she is working as someone who has talents, gifts, and strengths to share with the social worker, as well as with others in his or her community. The social worker’s role is to accept appropriate concern, affection, refreshments, and to become a “real” person within the relationship. Of course, there are clear limits to the relationship, in order to maintain professionalism. O’Leary et al. (2015) list a number of activities which are never appropriate, such as sexual relationships, exchanging money, and giving or receiving gifts of significant value. However, the more the social worker is able to see the person as being not just a recipient of the provider’s knowledge and service, but also as having something valuable to offer, the easier it will be for him or her to point out all the many ways in which the person may contribute to others in the community.

<td></td>
<td>How does the provider bring the basic human need to be helpful and needed into the service relationship?</td>
<td>That the person’s needs are being met in a meaningful way.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>How does the provider remain cognizant of opportunities for service to others as part of the journey towards self-determination?</td>
<td>The idea that the social worker’s needs are being met in a meaningful way.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>How does the provider bring the identified issues of structural oppression and historical context into discussion as a reason for giving to others?</td>
<td>The idea that the social worker’s needs are being met in a meaningful way.</td>
</tr>
</tbody>
</table>
Even small actions can have a large impact. It might be as simple as attending a community meeting about crime in the neighborhood that helps the person realize that he or she is not the only person who is concerned and willing to take action. It could also include writing letters to or making testimony before lawmakers. A critical area for recognizing and legitimizing power is voting, and social workers bear the responsibility of helping people with whom they work to understand the power of the vote, as well as their power to join with others to create substantive change through targeted voting. Social workers may even want to consider becoming voter registrants, so that they can register the people with whom they work to vote, and then help them become educated on the issues, without steering or directing the person about how to vote. Since developing power looks different for each person, the provider should move at a pace comfortable to the person with whom he or she is working, but should never lose sight of the ultimate goal.

Table 5: Power

<tr>
<td></td>
<td></td>
<td></td>
<td>* That the provider may experience a sense of loss and grief as the person builds self-determination.</td>
</tr>
</tbody>
</table>

Even small actions can have a large impact. It might be as simple as attending a community meeting about crime in the neighborhood that helps the person realize that he or she is not the only person who is concerned and willing to take action. It could also include writing letters to or making testimony before lawmakers. A critical area for recognizing and legitimizing power is voting, and social workers bear the responsibility of helping people with whom they work to understand the power of the vote, as well as their power to join with others to create substantive change through targeted voting. Social workers may even want to consider becoming voter registrants, so that they can register the people with whom they work to vote, and then help them become educated on the issues, without steering or directing the person about how to vote. Since developing power looks different for each person, the provider should move at a pace comfortable to the person with whom he or she is working, but should never lose sight of the ultimate goal.
Social Work Values and Ethics on the Line

Social workers promote social justice and social change with and on behalf of clients...Social workers are sensitive to cultural and ethnic diversity and strive to end discrimination, oppression, poverty, and other forms of social injustice. These activities may be in the form of direct practice, community organizing, supervision, consultation, administration, advocacy, social and political action, policy development and implementation, education, and research and evaluation. Social workers seek to enhance the capacity of people to address their own needs [emphasis added] (preamble, National Association of Social Workers, 2018).

Somehow, many social workers have read the above list of activities which must be employed to end social injustice as independent, mutually exclusive activities from which they may pick and choose as their interests allow, as opposed to as the problems dictate. Instead, the preamble describes an interrelated set of activities that must be layered upon each other to create as complex a set of solutions as the problems it is attempting to solve. Often, a focus on basic human needs and individual well-being (such as direct practice) is seen as incompatible with a focus on empowerment of vulnerable and oppressed people and well-being of society (such as advocacy). Clinical social workers must attend to the environmental factors that have contributed to their clients’ situations, and macro social workers must add to their focus on structural issues, a focus on individual well-being, as well as looking deeply at root causes of community problems. These root causes include oppressive historical and current-day policies and practices, as well as the impact of internalized oppression on people’s willingness to work to affect change in their communities.

The SHARP framework lays out a number of factors to consider and questions to ask in order to conduct social work practice with a full lens. Using this type of framework allows social workers to practice within the spirit of the complete code of ethics, as opposed to choosing some portions and avoiding others. The next step for the framework will...
be to outline specific actions for practitioners to take, both in clinical and in macro work. The framework might also be used in an educational setting, as a lens by which teachers and school staff may interact with students, caregivers and community members in building power. If social workers, educators, and other service providers all recognize the impact of structural oppression, and work with their clients toward the end of building power and supporting agency, we might begin to see more progress toward long-term, sustainable change.
